CMPE 320: HW 07

---

1. A radar tends to overestimate the distance of an aircraft, and the error is a normal random variable with a mean of 50 meters and a standard deviation 100 meters. What is the probability that the measured distance will be smaller than the true distance?

$$\begin{aligned}P(X < 0) &= P\left(Y < \frac{x - \mu}{\sigma}\right) \\&= P\left(Y < \frac{0 - 50}{100}\right) \\&= P(Y < -0.5) \\&= \Phi(-0.5) \\&= 1 - \Phi(0.5) \\&= 0.3085\end{aligned}\quad \square$$

2. Let  $X$  be normal with mean 1 and variance 4. Let  $Y = 2X + 3$ .

(a) Calculate the PDF of  $Y$ .

$$\begin{aligned}E[Y] &= E[2X + 3] \\&= 2E[X] + 3 \\&= 2(1) + 3 \\&= 5\end{aligned}$$

$$\begin{aligned}\text{var}(Y) &= \text{var}(2X + 3) \\&= (2)^2 \text{var}(X) \\&= (2)^2(4)\end{aligned}$$

$$= 16$$

The PDF of the normal random variable is

$$f_Y(y) = \begin{cases} \frac{1}{\sqrt{2\pi}} e^{-\frac{(y-5)^2}{32}}, & \text{if } -\infty < y \leq \infty, \\ 0, & \text{otherwise,} \end{cases} \quad \square$$

(b) Find  $P(Y \geq 0)$ .

$$\begin{aligned} P(Y \geq 0) &= P\left(Z \geq \frac{y - \mu}{\sigma}\right) \\ &= P\left(Z \geq \frac{0 - 5}{\sqrt{16}}\right) \\ &= P(Z \geq -1.25) \\ &= \Phi(-1.25) \\ &= 1 - \Phi(1.25) \\ &= 0.1056 \end{aligned} \quad \square$$

3. A signal of amplitude  $s = 2$  is transmitted from a satellite but is corrupted by noise, and the received signal is  $X = s + W$ , where  $W$  is noise. When the weather is good,  $W$  is normal with zero mean and variance 1. When the weather is bad,  $W$  is normal with zero mean and variance 4. In the absence of any weather information:

(a) Calculate the PDF of  $X$ .

□

(b) Calculate the probability that  $X$  is between 1 and 3.

□

4. Oscar uses his high-speed modem to connect to the internet. The modem transmits zeros and ones by sending signals  $-1$  and  $+1$ , respectively. We assume that any given bit has probability  $p$  of being a zero. The network cable introduces additive zero-mean Gaussian noise with variance  $\sigma^2$  (so, the receiver at the

other end receives a signal which is the sum of the transmitted signal and the channel noise). The value of the noise is assumed to be independent of the encoded signal value.

- (a) Let  $a$  be a constant between  $-1$  and  $1$ . The receiver at the other end decides that the signal  $-1$  (respectively,  $+1$ ) was transmitted if the value it receives is less (respectively, more) than  $a$ . Find a formula for the probability of making an error.

□

- (b) Find a numerical answer for the question of part (a) assuming that  $p = 2/5$ ,  $a = 1/2$  and  $\sigma^2 = 1/4$ .

□

5. An old modem can take anywhere from 0 to 30 seconds to establish a connection, with all times between 0 and 30 being equally likely.

- (a) What is the probability that if you use this modem you will have to wait more than 15 seconds to connect?

For the uniformly distributed normal variable

$$\int_{15}^{30} \frac{1}{30} dx = \frac{1}{30} x \Big|_{15}^{30} \\ = 0.5$$

□

- (b) Given that you have already waited 10 seconds, what is the probability of having to wait at least 10 more seconds?

$$\int_{20}^{30} \frac{1}{20} dx = \frac{1}{20} x \Big|_{20}^{30} \\ = 0.5$$

□

6. Consider a random variable  $X$  with PDF

$$f_X(x) = \begin{cases} 2x/3, & \text{if } 1 < x \leq 2, \\ 0, & \text{otherwise,} \end{cases}$$

and let  $A$  be the event  $\{X \geq 1.5\}$ . Calculate  $E[X]$ ,  $P(A)$  and  $E[X | A]$ .

□

7. Dine, the cook, has good days and bad days with equal frequency. On a good day, the time (in hours) it takes Dino to cook a souffle is described by the PDF

$$f_G(g) = \begin{cases} 2, & \text{if } 1/2 < g \leq 1, \\ 0, & \text{otherwise,} \end{cases}$$

but on a bad day, the time it takes is described by the PDF

$$f_B(b) = \begin{cases} 1, & \text{if } 1/2 < b \leq 3/2, \\ 0, & \text{otherwise,} \end{cases}$$

Find the conditional probability that today was a bad day, given that it took Dine less than three quarters of an hour to cook a souffle.

□

8. One of the two wheels of fortune,  $A$  and  $B$ , is selected by the toss of a fair coin, and the wheel chosen is spun once to determine the value of a random variable  $X$ . If wheel  $A$  is selected, the PDF of  $X$  is

$$f_{X|A}(x | A) = \begin{cases} 1, & \text{if } 0 < x \leq 1, \\ 0, & \text{otherwise,} \end{cases}$$

If wheel  $B$  is selected, the PDF of  $X$  is

$$f_{X|B}(x | B) = \begin{cases} 3, & \text{if } 0 < x \leq 1/3, \\ 0, & \text{otherwise,} \end{cases}$$

If we are told that the value of  $X$  was less than  $1/4$ , what is the conditional probability that wheel  $A$  was the one selected.

□
